

IN THE CLAIMS:

Please cancel Claims 1-9, 16 and 18 without prejudice or disclaimer of the subject matter recited therein.

Please amend Claims 10, 11 and 12 as follows.

Claims 1-9. (Cancelled).

10. (Currently Amended) A polarization converting element, comprising:
a periodic first blazed type grating portion and a periodic second blazed type grating portion which is arranged on a light exit side of the first blazed type grating portion, wherein
the first blazed type grating portion and the second blazed type grating portion are each formed by a plurality of grating sections, and a pair of grating sections corresponding to each other in each periodic first and second blazed type grating portions has the same period P_t , and
each of the grating sections forming at least one of the first blazed type grating portion and the second blazed type grating portion is formed by a sub-wavelength structure grating having a period p_l smaller than the period P_t , with the period p_l being smaller than a wavelength of a light beam used, and
wherein light beams are diffracted by the first blazed type grating portion and the second blazed type grating portion at a specific diffraction order, and

wherein said diffractive optical element is structured such that within an entire region of used wavelengths, diffraction directions are made different from each other, depending upon a polarization direction of a light beam incident on said diffractive optical element, and a diffracted light is concentrated only to one predetermined diffraction order, and

further comprising deflecting means provided so that an emergence direction of one of a P-polarized light beam and an S-polarized light beam which has undergone polarization-separation to be diffracted in a diffraction direction different depending on a polarization direction by said diffractive optical element ~~according to claim 2~~ is made substantially coincident with an emergence direction of the other beam.

11. (Currently Amended) A polarization converting element, comprising:
a periodic first blazed type grating portion and a periodic second blazed type grating portion which is arranged on a light exit side of the first blazed type grating portion, wherein

the first blazed type grating portion and the second blazed type grating portion are each formed by a plurality of grating sections, and a pair of grating sections corresponding to each other in each periodic first and second blazed type grating portions has the same period P_t , and

each of the grating sections forming at least one of the first blazed type grating portion and the second blazed type grating portion is formed by a sub-wavelength

structure grating having a period p_l smaller than the period P_t , with the period p_l being smaller than a wavelength of a light beam used, and

wherein light beams are diffracted by the first blazed type grating portion and the second blazed type grating portion at a specific diffraction order, and

wherein said diffractive optical element is structured such that within an entire region of used wavelengths, diffraction directions are made different from each other, depending upon a polarization direction of a light beam incident on said diffractive optical element, and a diffracted light is concentrated only to one predetermined diffraction order, and

further comprising a half-wave plate provided in correspondence to one of a P-polarized light beam and an S-polarized light beam, which has undergone polarization-separation to be diffracted in a direction different depending upon polarization direction, by said diffractive optical element according to claim 2.

12. (Currently Amended) A polarization converting element, comprising:
a periodic first blazed type grating portion and a periodic second blazed type grating portion which is arranged on a light exit side of the first blazed type grating portion, wherein

the first blazed type grating portion and the second blazed type grating portion are each formed by a plurality of grating sections, and a pair of grating sections corresponding to each other in each periodic first and second blazed type grating portions has the same period P_t , and

each of the grating sections forming at least one of the first blazed type grating portion and the second blazed type grating portion is formed by a sub-wavelength structure grating having a period p_l smaller than the period P_t , with the period p_l being smaller than a wavelength of a light beam used, and

wherein light beams are diffracted by the first blazed type grating portion and the second blazed type grating portion at a specific diffraction order, and

wherein said diffractive optical element is structured such that within an entire region of used wavelengths, diffraction directions are made different from each other, depending upon a polarization direction of a light beam incident on said diffractive optical element, and a diffracted light is concentrated only to one predetermined diffraction order, and

further comprising deflecting means provided so that an emergence direction of one of a P-polarized light beam and an S-polarized light beam which has undergone polarization-separation to be diffracted in a diffraction direction different depending on a polarization direction by said diffractive optical element ~~according to claim 2~~ is made substantially coincident with an emergence direction of the other beam and a half-wave plate is provided in correspondence to one of the P-polarized light beam and S-polarized light beam.

13. (Previously Presented) A polarization converting element according to any one of claims 10 to 12, further comprising an optical member provided so that an incident direction of a light beam on said diffractive optical element is made substantially parallel to an emergence direction thereof.

14. (Original) A projection type display apparatus, in which a light beam which is emitted from a light source unit and contains an S-polarized light component and a P-polarized light component, is guided using the polarization converting element according to any one of claims 10 to 12 toward modulating means for modulating the light beam on the basis of an image signal and the light beam modulated by said modulating means is projected onto a predetermined surface by a projection optical system.

15. (Original) A projection type display apparatus according to claim 14, wherein said image signal is controlled in response to a signal supplied from an image processing means.

Claims 16-18. (Cancelled).
